

What is new for Flock Profiles?

Exciting changes are coming to the report that allows commercial Merino flocks to genetically benchmark compared to industry when using rams with ASBVs

A Flock Profile involves genotyping 20 randomly selected animals from the current drop of lambs, it will then provide you with a flock average breeding value comparable to the Sheep Genetics database.

Flock Profiles have provided benchmark comparisons for key production groups such as:

- *Fleece quality and quantity*
- *Growth*
- *Carcase*
- *Health*

Moving forward, Flock Profile will continue to include these traits with the addition of:

- *Reproduction (Weaning Rate)*
- *Condition Score*
- *New MERINOSELECT Indexes*

Changes will be available as of the 21st of September 2024 MERINOSELECT run

Changes will be automatically applied to any Flock Profiles created on or after this run.

For those who have previously purchased a Flock Profile, Sheep Genetics is able to re-run your report with these additional traits included. To have your report re run please contact Sheep Genetics by Emailing info@sheepgenetics.org.au or calling 02 8055 1818
